

HOW TO MANAGE SIMPLE FADDY EATING IN TODDLERS

www.infantandtoddlerforum.org

LEARNING POINTS

- 1 Toddlers show clear behavioural signals when they have had enough to eat.
- 2 Some parents may need help in recognising these signals.
- 3 The more anxious the parent, the more likely the toddler will have eating problems.
- 4 Toddlers should be allowed to feed themselves, to make a mess and to decide when they have eaten enough.
- 5 Anxious parents are less likely to allow toddlers to take control of mealtimes.
- 6 Parents should not pressure, bribe or force feed their toddler.
- 7 Parents should not use one food as a reward for eating another.
- 8 Parents should give toddlers attention when they are eating, not when they stop eating.
- 9 Too much fluid intake, either milk, juice or squash, may reduce food consumption.
- 10 Constipation, anaemia or other medical conditions need to be treated before trying to change eating behaviours.
- 11 Toddlers should be offered a regular meal pattern of three meals and two to three planned snacks each day.
- 12 Guidance, reassurance and support can give parents the confidence to change toddlers' mealtime routines.

SUCCESSFUL MEALTIME MANAGEMENT

Most toddlers have good and bad days, when they either eat well or refuse to eat foods that they usually like. However, some toddlers are more difficult with food than others, and this is a problem that concerns many parents, especially when they are trying to follow healthy eating advice.

Toddlers learn by copying other children and adults. Encouraging the family to eat together can be an important part of learning to like new foods.

Successful management of toddler eating behaviour requires a number of skills that parents may need to learn. Indeed, it is significant that many faddy-eating toddlers start to eat more at a nursery, where the staff may be skilled at mealtime management.

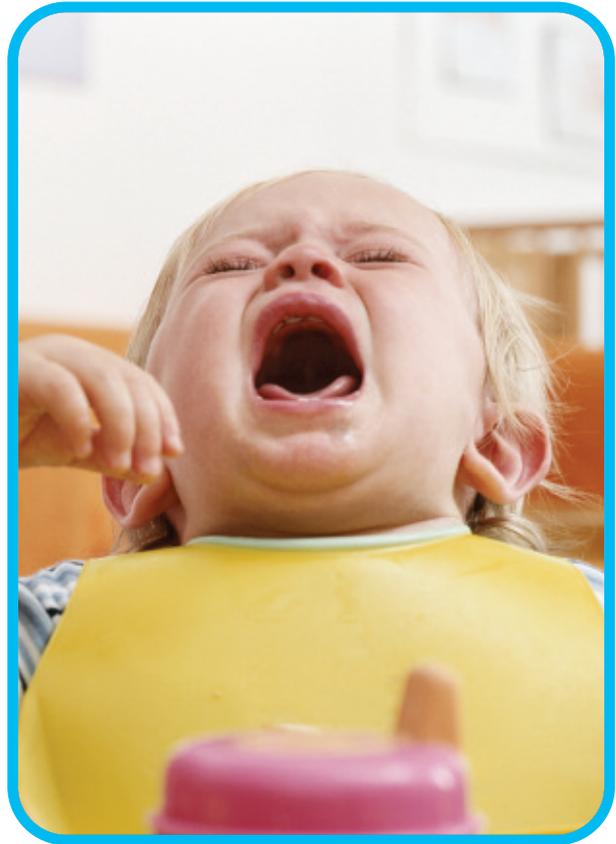

RECOGNISING SATIETY SIGNALS

Parents can be helped to recognise the behavioural signals that indicate their toddler has had enough food¹.

Toddlers are saying they do not want more food when they:

- say no
- keep their mouth shut when food is offered
- turn their head away from the food being offered
- push away a spoon, bowl or plate containing food
- hold food in their mouth and refuse to swallow it
- spit food out repeatedly
- cry, shout or scream
- gag or retch

Toddlers showing these behaviours during a meal are trying to avoid being fed. One reason for this may be that the parents are expecting their toddler to eat more than they need to. These parents may, for instance, continue with spoon-feeding long after their child should have begun feeding him/herself. In these cases it is often sufficient simply to reassure the parents that their child is eating enough and growing well.

Parents should be reassured that most toddlers are capable of regulating their intake of food and drinks according to their own particular nutritional needs. They should therefore be encouraged to allow their child to progress to self-feeding and feel confident to stop feeding their child when he/she shows signs of food refusal.

CHECK FLUID INTAKE FROM MILK AND OTHER DRINKS

One common reason why toddlers have no appetite at mealtimes is that they have had too many calories (energy) from drinks such as milk and sweetened drinks. About six to eight drinks per day is usually enough – a drink should be offered with each meal and snack. An average drink for a toddler is about 120mls in a cup or beaker. Feeding bottles should have been phased out by 12 months.

Too much milk

If a toddler is having too much milk from a cup this is easy to reduce. However, if a toddler insists on a bottle, then reducing the amount of milk can be more difficult.

Daytime bottles are easiest to remove, especially if the toddler is out of the house and attends a nursery or a playgroup. They should be gradually reduced one by one and replaced with food and a cup of milk.

The evening bottle at bedtime can be more difficult for the toddler to relinquish, but it is less likely to affect food acceptance during the day.

Night-time feeding should be avoided because this will reduce a toddler's appetite for food during the day. When a toddler habitually wakes for a bottle during the night, the volume of milk should be gradually reduced until the toddler has started to eat more during the day. Some parents may do this by gradually diluting the milk with water.

The aim should be to eventually limit milk and milk products to three servings per day. [See Factsheet 1.1](#)

Too many sweet drinks

Similarly, too much fluid from sweet drinks such as fruit juices, squashes and fizzy drinks can suppress appetite for food². Toddlers should have all drinks in cups rather than bottles and water should be given when drinks are demanded between meals and snacks, especially within an hour of a meal or snack.

ENCOURAGE THE MOVE FROM SPOON TO SELF-FEEDING

Toddlers usually want to move on to self-feeding in the second year – they want both to eat with their fingers and gain control of the spoon. This transitional stage is a continuum, and children learn chewing and feeding skills as a result of being given more difficult

textures to cope with. Some toddlers are happy to be spoon-fed until a late age, but of course this will stop them from moving on to more appropriate foods, and gaining the appropriate feeding skills.

Sometimes parents are also reluctant to progress from spoon-feeding their child with a commercial or home-made baby food. This may be because they are anxious about moving to the next stage of toddlers' diet; they may fear that their child will choke, or fail to eat and grow if he or she stops these early foods. Parents may also be reluctant to progress to self-feeding because this is a very messy process, and some parents feel anxious and uncomfortable if their child makes a mess, or becomes very messy during the mealtime.

Appropriate guidance can help these parents in making a late transition from spoon to self-feeding. Parents should be advised to try just one meal a day to begin with, at which the toddler is allowed to self-feed. As the toddler becomes more successful at self-feeding, the number of meals at which the parent feeds the child exclusively can be reduced. Of course a toddler should never be left alone to feed him/herself.

AVOID FORCE-FEEDING AND REWARDS

Increased anxiety around mealtimes can result in parents force-feeding their toddlers^{3,4}, or trying to reward them for eating food that they do not want. Force-feeding at mealtimes will make a toddler anxious and frightened around food. It can mean that the toddler will lose his/her appetite before he/she even starts the meal.

Other parents coax, bribe and plead⁵, and the mealtime may go on for far too long. Most toddlers eat whatever food they are going to eat in the first 20 minutes of the meal.

CHECK FOR MEDICAL CAUSES

It is important that toddlers are given control over their mealtimes and their intake⁴. They need to be allowed to handle their food, and to make a mess with it. They are usually happier with finger feeding, although they may like help with some runnier foods.

Parental anxiety can affect a child, so parents should be advised not to talk about food and eating in front of their toddler, or to place too much emphasis on how much is eaten at mealtimes. Toddlers are likely to eat more if everyone around them is calm. They will eat more if parents attend to them, by talking or smiling, when they are eating; they will eat less if the parents start to give them more attention when they stop eating⁶.

Some parents try to reward their toddler for eating or use one food as a reward for eating another. For example, they might not give a pudding until a first course is finished. These are not useful strategies. Toddlers can lose their appetite for one taste, and yet still have an appetite for another. Any food that is used as a reward becomes more desirable than the food that they are rewarded for eating⁵.

Likewise, too many high calorie snacks in between meals can result in the toddler demanding the snack food and refusing the mealtime food. Parents should therefore follow a regular daily routine of three toddler-sized meals with two to three planned snacks evenly spaced between meals. Any biscuits or sweets should be given as part of the meal or snack, rather than in between.

Constipation may be due to too little fluid. Check that toddlers are having six to eight drinks per day of about 120mls. Treatment for the constipation, from the GP, needs to begin before trying to change eating behaviours.

Anaemia, reflux and swallowing difficulties.

If you suspect any of these may be part of food refusal refer to the GP for assessment.

IF LIMITED FOOD INTAKE PERSISTS

It is important to reassure anxious parents that faddy eating will usually resolve in time.

However a minority of toddlers persist in eating very little and this may affect their growth and development. If no medical cause for the problem can be identified, it is likely that the toddler is strongly neophobic about food, and has an extreme sensory sensitivity. Under these circumstances it may be appropriate to refer the child to a clinical child psychologist or a specialist feeding team if available.

Factsheet 2.3

contains information for healthcare professionals, parents and carers of toddlers who are extreme food refusers.

The guidance and content in this Factsheet is based on a combination of evidence based research and practical clinical experience.

HOW TO MANAGE YOUR TODDLER'S FADDY EATING GUIDANCE & TIPS FOR PARENTS

- If your toddler is a faddy eater you may be aware of how easily mealtimes can turn into a nightmare of refused food, tantrums and frustration.
- Fortunately most toddlers grow out of the problem and eventually learn to eat a variety of foods.
- There are medical reasons why your toddler might not eat. The most common ones are:
 - your toddler is constipated
 - your toddler is anaemic

If you suspect that your toddler is either constipated or anaemic it is important to seek advice from your health visitor or GP.

Learning to eat is like any other learning process - it takes time. As parents there are a number of things you can do to help to ensure that you and your toddler will, once again, be able to enjoy food together.

	Do	Reason
	Eat with your child as often as possible.	Toddlers learn by copying their parents and other children.
	Develop a daily routine of three meals and two to three snacks around your toddler's sleeping pattern.	Toddlers don't eat well if they become over hungry or very tired.
	Offer two courses at meals: one savoury course followed by a sweet course.	This gives two opportunities for the toddler to take in the calories and nutrients needed and offers a wider variety of foods. It also makes the meal more interesting.
	Praise toddlers when they eat well.	Toddlers respond positively to praise.
	Make positive comments about the food.	Parents and carers are strong role models. If you make positive comments about foods, toddlers will be more willing to try them.
	Arrange for toddlers to eat with other toddlers as often as possible.	Some toddlers eat better when they are with their own age group.
	Give small portions. If these are finished, praise the toddler and offer more.	Toddlers can be overwhelmed by large portions and lose their appetite.
	Offer finger foods as often as possible.	Toddlers enjoy having the control of feeding themselves with finger foods.
	Eat in a calm, relaxed environment without distractions such as TV, games and toys.	Toddlers concentrate on one thing at a time. Distractions make it more difficult to concentrate on eating.
	Finish the meal within about 20-30 minutes and accept that after this the toddler is not going to eat any more.	Carrying the meal on for too long is unlikely to result in the toddler eating much more. It is better to wait for the next snack or meal and offer nutritious foods then.
	Learn to recognise the signs that your child has had enough, and remove the uneaten food without comment.	Toddlers are saying they have had enough food when they: <ul style="list-style-type: none"> • say no • keep their mouth shut when food is offered • turn their head away from food being offered • push away a spoon, bowl or plate containing food • hold food in their mouth and refuse to swallow it • spit food out repeatedly • cry, shout or scream • gag or retch

	Do	Reason
	Take away uneaten food without comment.	Accept that the toddler has eaten enough.
	Involve toddlers in food shopping and preparing for the meal such as putting things on the table.	This will encourage your toddler to have a positive attitude to food.
	Involve toddlers in simple cooking and food preparation.	Handling and touching new foods without pressure to eat them will help your toddler become familiar with new foods and more likely to try them.
	Change the venue of meals. For example, have a picnic outside.	This will make eating and food a fun experience for your toddler and will allow them to see others enjoying food.
Make a list of all the food your child does eat over a week and then review it.	If there are foods from all the food groups and some variety within each group then you can reassure yourself that the problem may not be as bad as you thought.	

	Don't	Reason
	Rush a meal.	Some toddlers eat slowly and rushing a toddler to eat can reduce their appetite.
	Insist your toddler finishes everything on his/her plate or pressure a toddler to eat more when he/she has indicated to you they have had enough.	Toddlers should be allowed to eat to their appetite and parents and carers should respect this.
	Pressure a toddler to eat more when he/she has indicated to you they have had enough.	
	Take away a refused meal and offer a completely different one in its place.	A toddler will soon take advantage if you do this. In the long run it is better to offer family meals and accept that your child will prefer some foods to others. Always try to offer one food at each meal that you know they will eat.
	Offer the sweet course as a reward.	You will make the sweet course seem more desirable.
	Offer large drinks of milk, squash or fruit juice within an hour of the meal.	Large drinks will reduce your toddler's appetite. Give water instead.
	Offer snacks just before a meal.	The snacks will stop them feeling hungry.
	Give a snack very soon after a meal if they haven't eaten well at the meal.	Many parents may do this just to ensure their toddler has eaten something. However it is best to have a set meal pattern and wait until the next snack or meal before offering food again.
	Assume that because they have refused a food they will never eat it again.	Tastes change with time. Some toddlers need to be offered a new food more than ten times before they feel confident to try it.
Feel guilty if one meal turns into a disaster.	Put it behind you and approach the next meal positively. Parents also learn by making mistakes.	

If faddy eating persists and you are still worried about your child's feeding habits, consult your health visitor or GP who will advise you on what help is available.
